

## SAFETY HOOKS FOR CHAIN BLOCK

**General** Safety Hooks are specially designed hooks, which are connected to the chain block in order to produce a positive and reliable connection to various sections and constructions. The use of suitable Safety Hooks will contribute to the safety and protect the chain block from unnecessary damages and deformations of the hooks.

It is forbidden to use the Safety Hooks as lifting appliances!

**Technical data** Safety Hooks are designed to be used together with 3 tonnes chain blocks. Craftmer strongly recommends that the actual force on the chain block lever needed for producing a 3 tonnes tension on the chain is tested prior to the actual work. This is due to the fact that chain blocks are often overloaded at work.

The Craftmer chain block Safety Hooks are produced in two universal designs to suit optimally to various applications. Models 3 and 4 are universal Safety Hooks fitting to the most sections used in ship structures. The weight of the Extra Hook is app. 1,7 kg.

**Operating Instruction** Choose the suitable Safety Hook to the actual work and connect it to the optimal location on the structure/item to be installed so that a safe connection is created. Connect the chain block to the eye of the Safety Hook.

Make sure that pulling arrangement is safe!

If there is a risk that the Safety Hook might slack or fall off, it can be clamped to the location by using a wedge.
